Curing the Cable Clutter

LAN systems have revolutionized interconnectivity, but they can get bogged down in tangles of cables, static positioning and limited growth potential.

Now BridgeLinkT™, the wireless lOBaseT hub and transparent bridge, provides invisible connectivity, making the workspace a dynamic entity once again - moving, expanding and repositioning in response to current and growing needs.

Management Station

BridgeLink™ M • the Invisible Solution

BridgeLink ™M requires no additional hardware or software other than a small Ceiling Unit and smaller Transceiver Units (with lOBaseT interface) attached to each device in your network. These Transceiver Units allow every device in the network to interact directly with every other device. When distances between them increase, communication is routed via the Ceiling Unit. In this way the entire network enjoys high speed commmunications, uninterrupted by movement and regardless of position.
